

AWIA SDIP®

Comprehensive solutions for public transport vehicles

MANAGEMENT APPLICATION

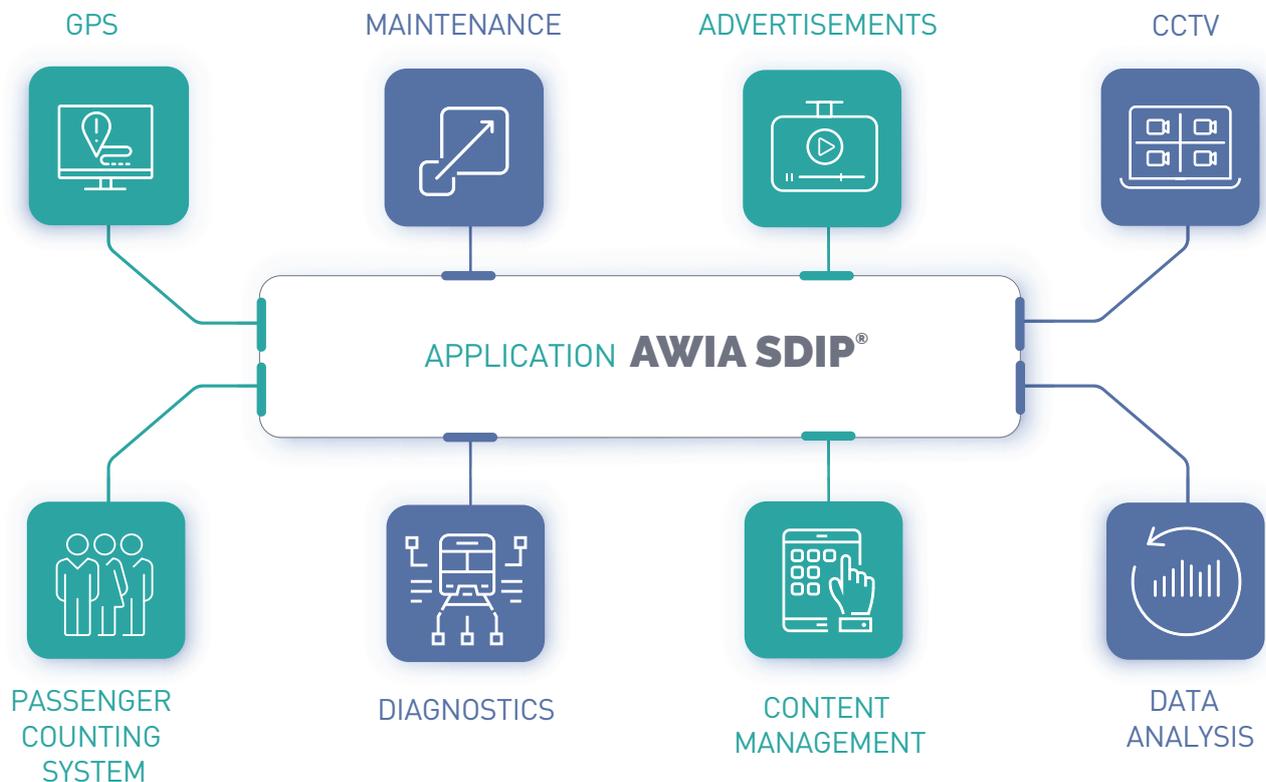

Integrated Fleet Management System

MANAGEMENT APPLICATION

MANAGEMENT APPLICATION is used to monitor the operation of all onboard devices of the AWIA SDIP® system, which operates in public transport vehicles. This app is installed on a server and access is available via a web browser.

The primary task of the application is to process, archive and present data from the vehicle.

The onboard devices of the AWIA SDIP® system interface with the **MANAGEMENT APPLICATION** through the Onboard Computer which is equipped with an integrated GSM/GPRS/EDGE/HSPA/LTE/5G modem.

Application AWIA SDIP was developed based on the extensive experience of ENTE's programmers and is continuously improved and updated in line with Customer needs.

GPS

Thanks to the **GPS** tab it is possible to track the current position of vehicles, as well as their historical routes, on a digital map. Icons placed on the map indicate the location of a specific vehicle. The map can be zoomed in and navigated using the on-screen cursor.

MAINTENANCE

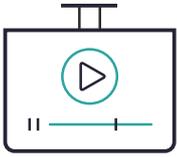

The **MAINTENANCE** module provides access to real-time data of the fleet's condition. Here, users can report and manage faults, create work orders, and schedule inspections for vehicles and components installed in the vehicle.

Additionally, the module offers access to the history of performed tasks, vehicle availability and usage.

- Failures
- Service orders
- Fleet usage planning
- Fleet availability
- Component inspections
- Planning of vehicle inspections

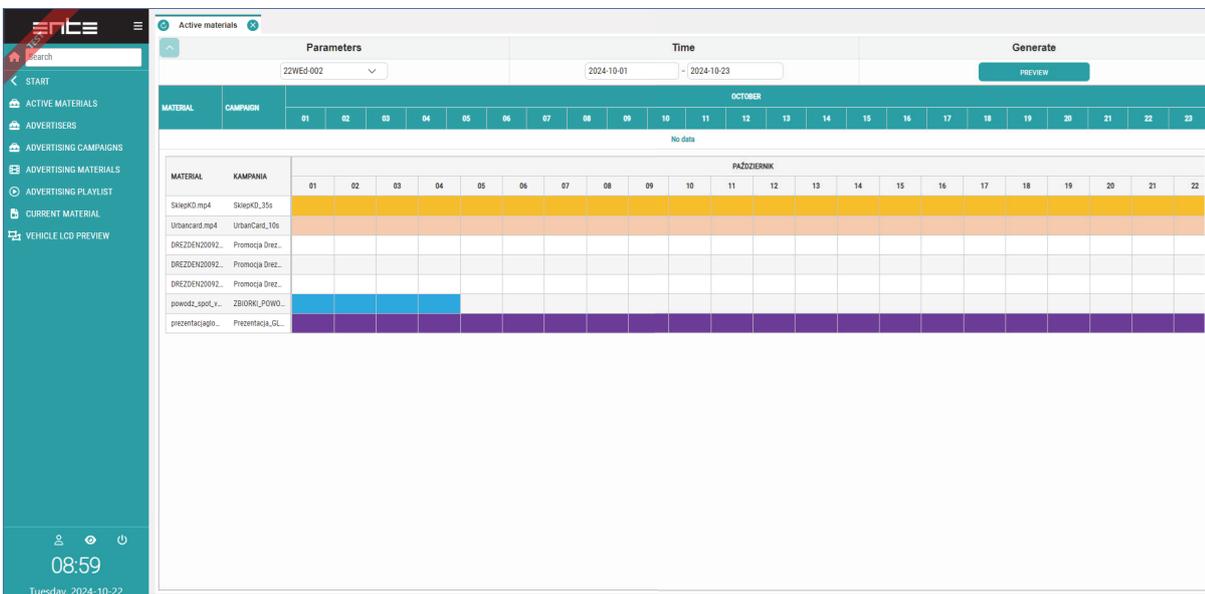

The MAINTENANCE module

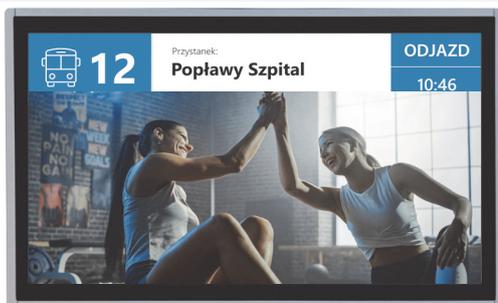

ADVERTISEMENTS

Ttabs within the **ADVERTISEMENTS** module allow the user to manage advertising campaigns. In this section users can create a list of advertisers, manage entire advertising campaigns, oversee the materials used, and check which content is currently being displayed. This module enables to create the content shown to passengers both inside and outside the vehicle.

ENTE offers displays and monitors in various sizes and resolutions. The available LED displays come in amber, multicolor (RGB), and white versions, and are offered in various sizes and resolutions.

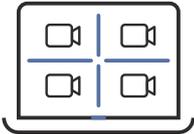

Advertisements - Active Materials Tab

LCD-24" monitor GL

LCD-37" monitor GL

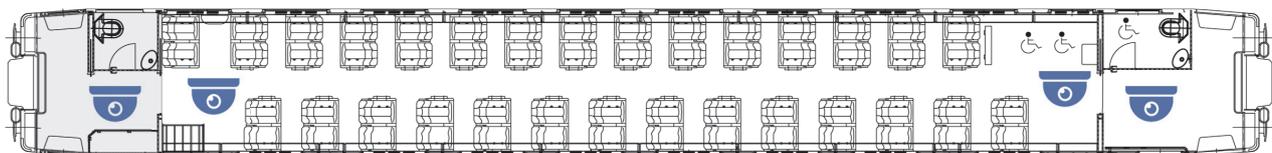

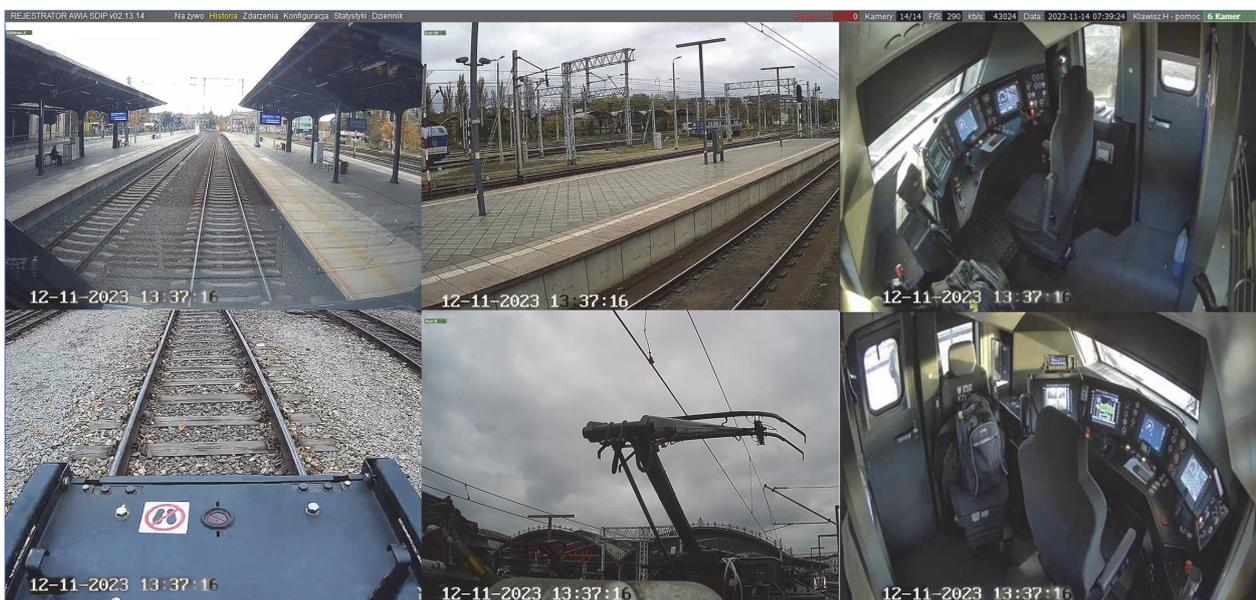

CCTV

Tabs within the **CCTV** module allow to manage the video surveillance system installed in vehicles. This primarily includes managing data on video recorders, flashes monitoring, and recorded footage protection.

The video surveillance system offered by **ENTE** can include, in addition to the recorders: railroad cameras, mirror cameras, pantograph cameras, train coupling cameras and cameras for monitoring the vehicle's interior.

The video recording, along with additional parameters (e.g., GPS location, station and stop names, train and line numbers, alarm events), is carried out using a video recorder.

„The camera feed is displayed on dedicated LCD terminals with a touchscreen or on control terminals installed in the vehicle cabins”.

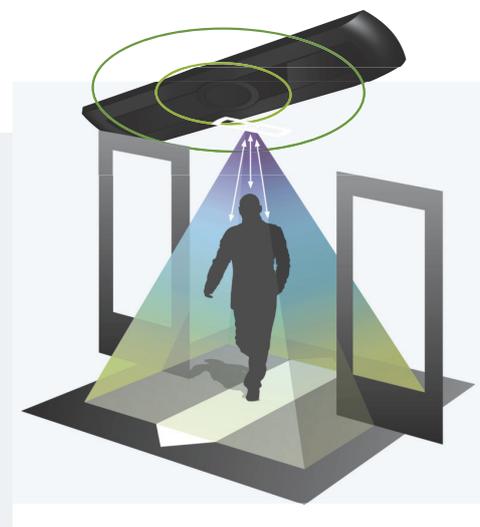

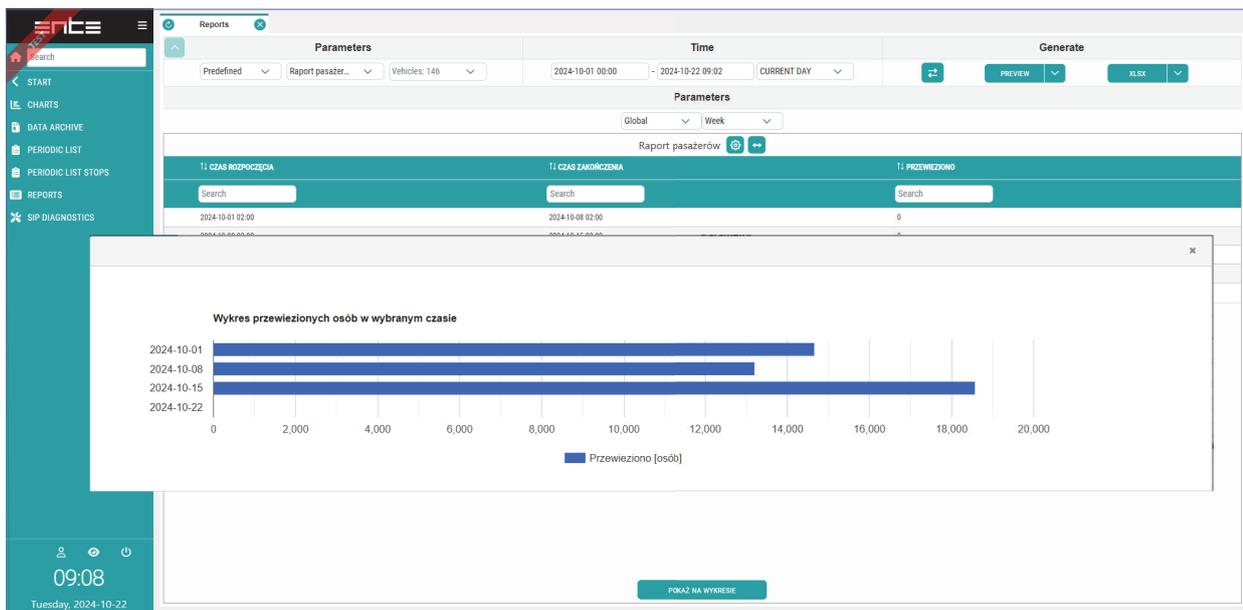

Terminal LCD-10”

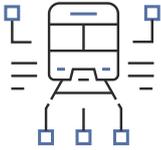

PASSENGER COUNTING SYSTEM

Data from individual counting units is transmitted in real-time via the Onboard Computer to the **Management Application**, which analyses and presents the received information. The visualization of the collected data is available through browser-based software. The provided data on passenger flows enables the operator to forecast passenger demand on the line and appropriately allocate the fleet size for transport tasks, thus optimizing transport plans.

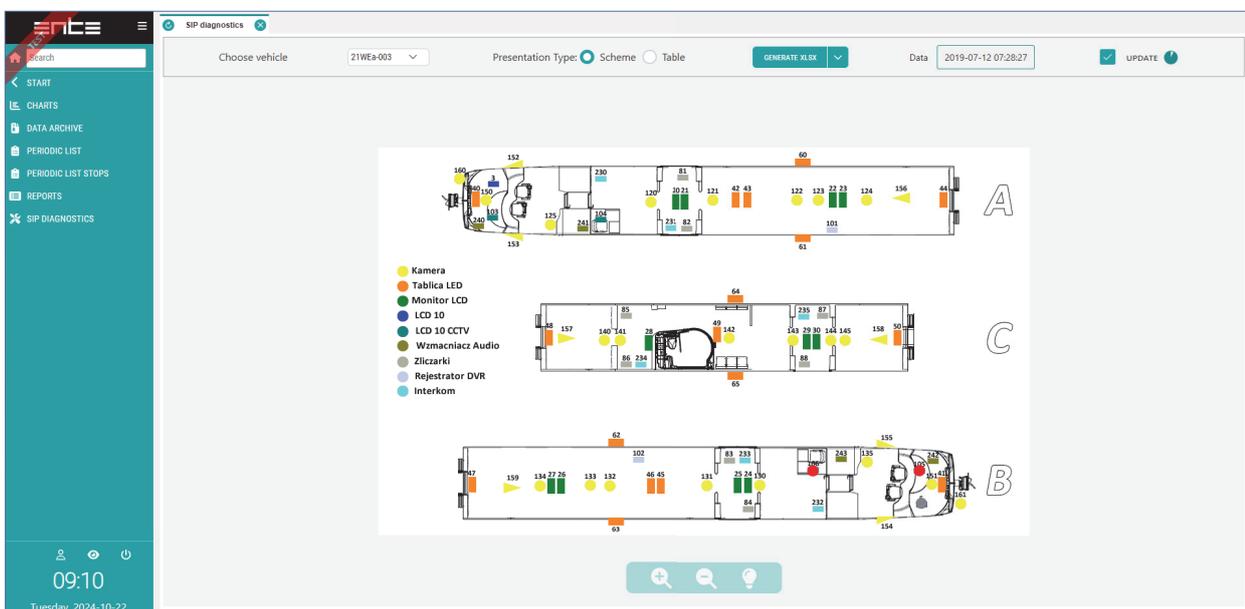

DIAGNOSTICS

The **DIAGNOSTICS** module enables verification of the operational status of devices installed in the vehicle. A schematic of the selected vehicle displays symbols representing all devices of the AWIA SDIP® Dynamic Passenger Information System installed in the vehicle.

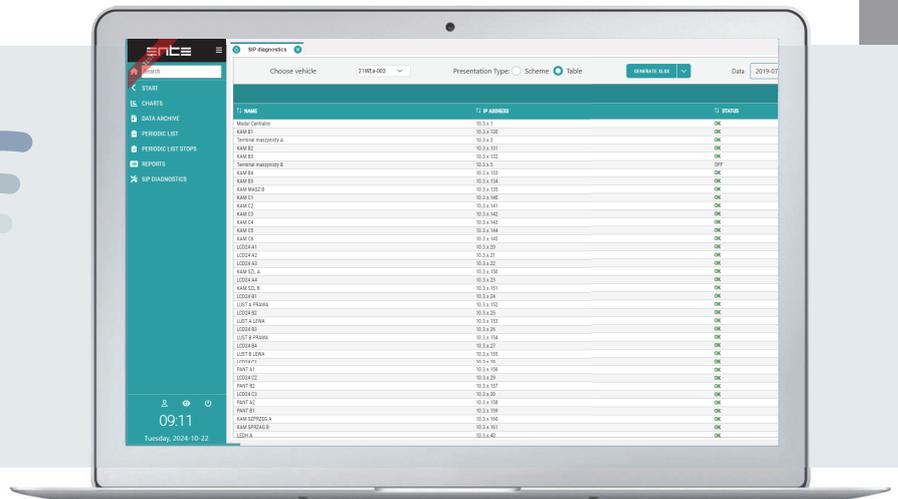

Each device type is color-coded. Additionally, each device is assigned a unique IP address. Users can choose between two information display formats - either a schematic or a table - depending on their needs.

Diagnostics – Example Schematic

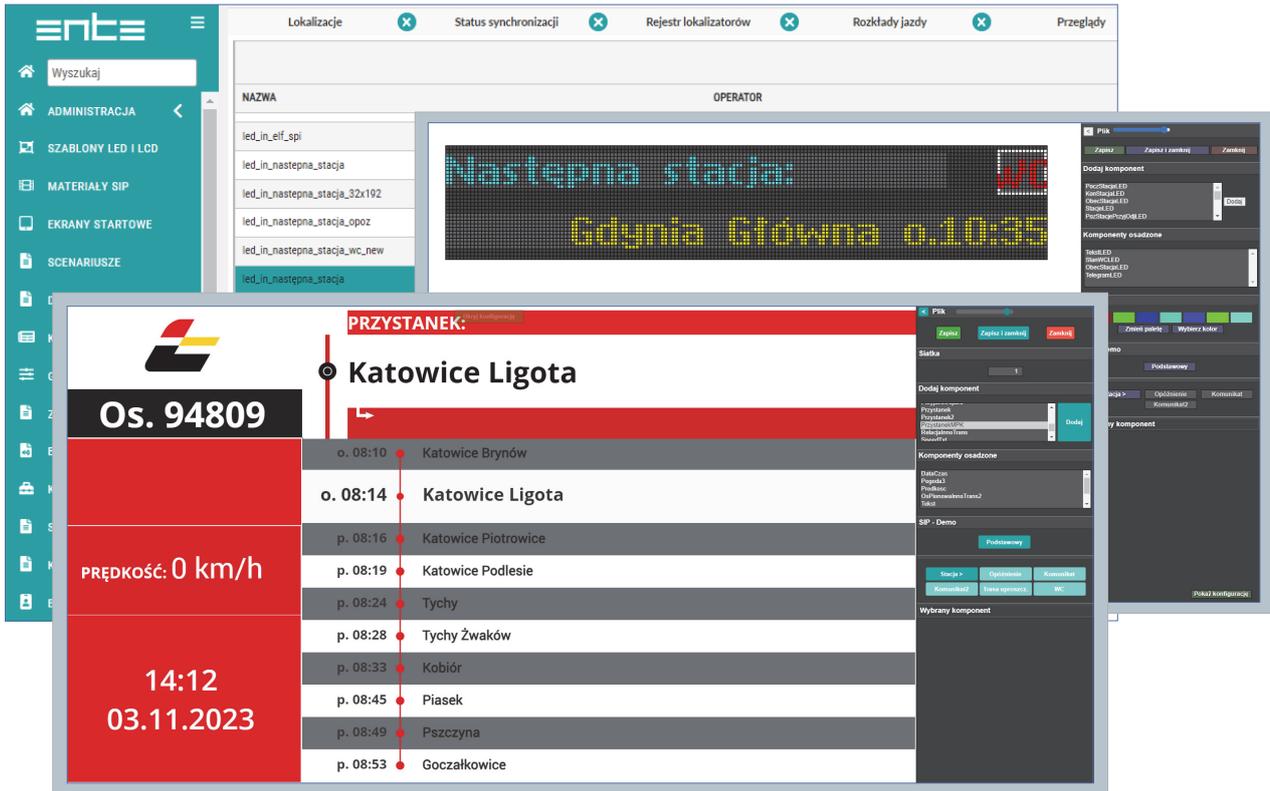

Diagnostics – Sample Table

CONTENT MANAGEMENT

The **CONTENT MANAGEMENT** module is used for managing the information displayed on LED boards and LCD monitors. Each type of display has an assigned set of templates that can be utilized to prepare the displayed content. The module provides functionality for adding new templates, editing and deleting existing templates, and previewing the created messages.

The module is used to generate the following information:

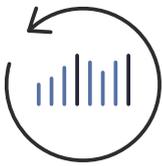

- Direction of the vehicle along with the route display (scrolling text)
- Current vehicle position on the map
- Current or next station
- Line number / car number
- Departure time
- Delay
- Current time, date, and day of the week
- Door status (e.g., open)
- Number of passengers boarding the vehicle
- Hot News type information
- Alerts

RGB LED Boards 64x160

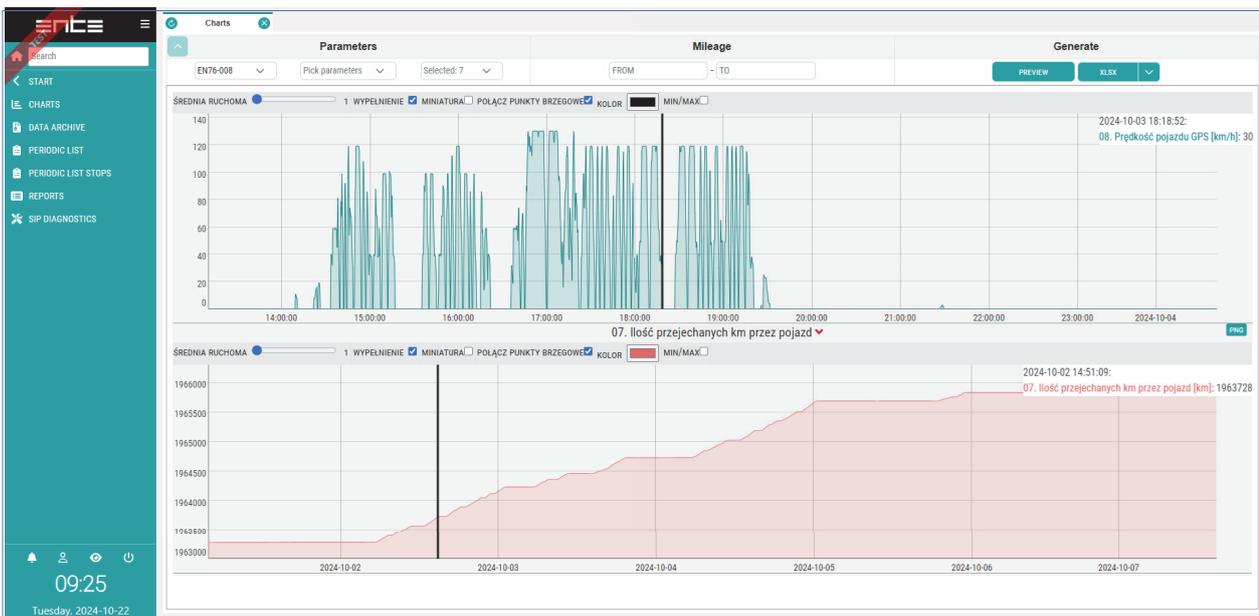

LCD Monitor 24"

DATA ANALYSIS

The set of tabs within the **DATA ANALYSIS** module allows for the statistical analysis of parameters originating from the vehicle. The module enables the generation of charts and reports based on data available in the **AWIA SDIP®** Dynamic Passenger Information System. Moreover, it provides the capability to analyse the operational status of onboard devices based on diagnostic data and to review the location history of a selected vehicle. Information can be displayed on a monitor or saved as a file (in .xlsx, .pdf, .csv, .png, or .gpx formats) for archiving or printing purposes.

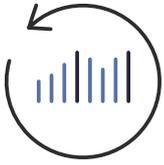

Data Analysis Tab – Example Charts

The screenshot displays the 'Reports' tab with a 'Raport przystanków' (Stop Report) table. The table lists stop events for vehicle 67551-1632252, including station names like Legnica, Rzeszotary, and Zielona Góra Stary Kisielin, along with arrival and departure times and delays.
