OLIMP

Description of the system

OLIMP is a reliable & practical ticket and entry control solution.

The system is characterized by high reliability and functionality. It allows for efficient management of the entire process related to ticket sales and verification, access control, and individual identification

How it works

OLIMP consists of hardware devices and a central software app supporting checkout applications, internet sales portal and administrative applications.

Each event participant with a valid ticket shall be subject to electronic control while entering a facility where an event occurs.

Purpose

The system is used in particular in ticketing mass events such as sports events. The solution improves safety during the event and complies with applicable laws regarding the organization of events e.g. *UEFA or FIFA regulations. The Olimp system is not only events management but works well on the daily management of the venue.*

Benefits

✓ Improve the process of selling and distribution tickets
✓ Improving entry control into a given facility
✓ Increase the security level of mass events
✓ Supporting the work of security services
✓ Increasing the attractiveness of a particular facility
✓ Expanding sales channels to online ticketing platform
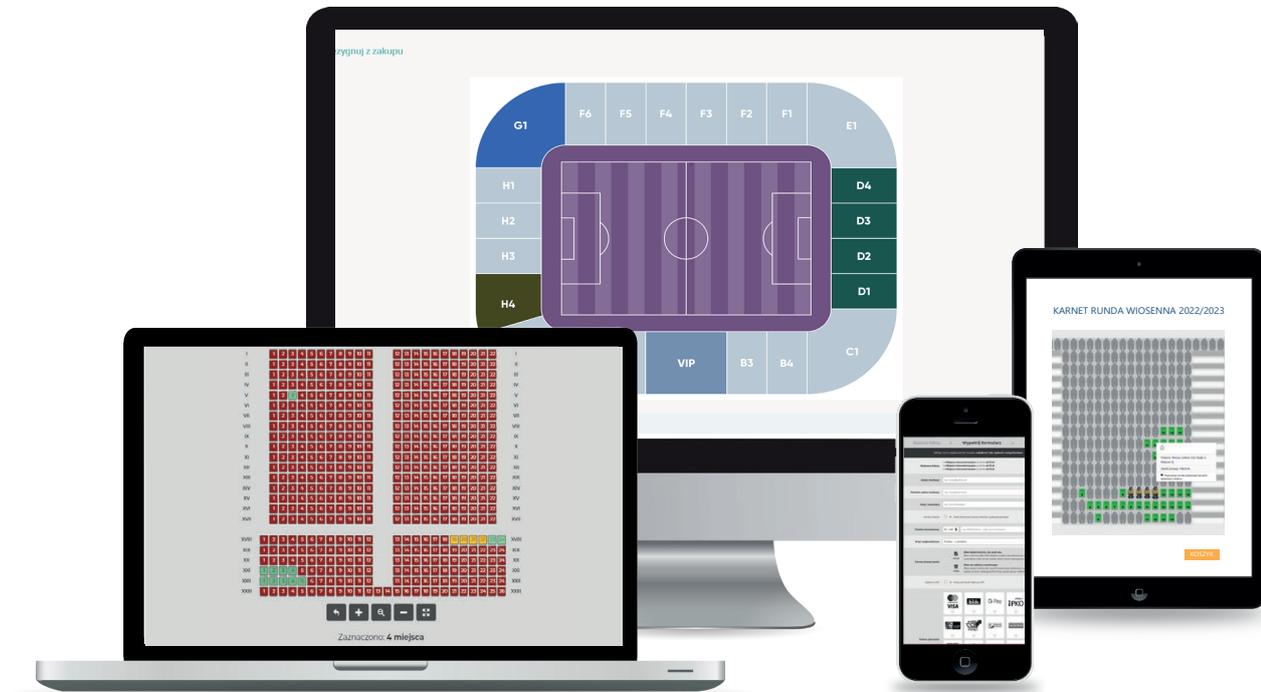

OLIMP

Design of the system

- Mechanical and electronic access control devices: high turnstiles (turnstile gates), low turnstiles (tripods), entrance barriers, stationary ticket readers, and portable access control points (mobile devices like Palmtops)
- Electronic devices responsible for controlling lockers on the premises (e.g., at a swimming pool)
- Electronic devices (readers) for independent verification of time spent on the premises
- Installation providing power to all system components
- Control and event logging center, which includes the necessary equipment and software for real-time event registration in access control, personal identification, and sales handling
- Cashier stations and system administrator workstations
